

Whale Tracks

Crypto Perpetuals — Long-Only, Order-Flow & Event-Driven Momentum

Detecting the footprint of large capital to capture explosive upside in newly-listed, low-float coins — long-only, entering with the confirmed flow and riding the continuation. Revised & re-validated June 2026.

Strategy Overview

Whale Tracks is a systematic, **long-only** strategy for crypto perpetual futures. It reads the footprint of large players through positioning, order-flow (cumulative volume delta, CVD) and volume signals to identify low-float coins poised for explosive, event-driven upside. It buys with the confirmed flow and rides the continuation, exiting on a protective stop or a time limit. It never shorts.

Methodology

- **Universe:** liquid USDT-margined perpetuals, dynamically re-screened every 21 days for names whose positioning extremes have recently preceded outsized moves. This coin selection is the core of the edge.
- **Setup:** a positioning/crowding extreme combined with a volume surge.
- **Confirmation:** order-flow (CVD) must agree with the long direction before entry.
- **Direction:** long-only continuation — buy with the confirmed flow; never fade, never short.
- **Entry / Exit:** immediate on confirmation; fixed protective stop plus a time-based exit, with no profit caps so winners run.
- **Sizing:** small, equal-weight positions; maximum 8 concurrent; per-coin size capped to a fraction of daily volume.

Validation

Performance is established by a **walk-forward, out-of-sample test** (Nov 2024 – Jun 2026, 19 months) across **520+ coins**, comprising **317 trades**. The tradable universe is re-screened every 21 days using only prior data, and the rules are held fixed throughout — no curve-fitting. Results are net of fees, slippage and funding/carrying costs. Returns are fat-tailed: the median trade loses ~2.6% and a minority of high-payoff trades (top coins account for most of net profit) drive performance — so the system must take every qualifying signal and diversify broadly.

Walk-forward equity curve and drawdown — flat 5% sizing, max 8 concurrent positions.

Example — Entering Before the Move

A representative long: MYX traded flat for days, then ignited. The system bought into the early breakout (2025-09-07) and exited into strength (2025-09-10) for **+649%** — the fat-tail outcome the strategy is built to capture.

Monthly Performance

Month	Return	Max DD	Trades	Win %
2024-11	-2.1%	-2.4%	15	40%
2024-12	+10.1%	-1.0%	10	60%
2025-01	-0.4%	-0.4%	3	0%
2025-02	+0.1%	-0.9%	5	20%
2025-03	+1.2%	-0.8%	7	71%
2025-04	-0.5%	-2.3%	12	58%
2025-05	+3.6%	-1.5%	8	75%
2025-06	-1.3%	-2.1%	7	43%
2025-07	+5.4%	-1.2%	15	53%
2025-08	+1.4%	-1.8%	7	29%
2025-09	+44.2%	-1.6%	18	44%
2025-10	-4.9%	-4.3%	20	20%
2025-11	-6.5%	-8.5%	32	28%
2025-12	-0.4%	-2.5%	29	41%

Risk Management

Every position carries a hard stop; total exposure is capped by an 8-position limit and by per-coin liquidity limits; the book is marked-to-market each hour. The strategy is designed for small-to-mid capital and is capacity-limited by design — it deliberately trades only where the edge is liquid enough to capture.

What This Strategy Is NOT — and the June 2026 Revision

Revision history. Earlier versions of this report (and figures previously shown elsewhere, e.g. 120% annualized / 11% drawdown) included short positions and a secondary volume-ignition long playbook. A June 2026 re-validation found an accounting-convention error that overstated short-side results; once corrected, the short legs showed no edge and the ignition-long playbook's profits depended on a handful of outlier trades. Both were removed. The strategy now runs its core long playbook only, and all figures in this report reflect that corrected, long-only specification.

- **Not a short or hedged strategy.** It is long-only and fully directional; it will lose in broad small-cap downturns and holds no offsetting shorts.
- **Not a high-win-rate system.** It wins ~39% of trades and the **median trade loses ~2.6%**; the average is carried by rare large winners. Long flat or losing stretches between big months are normal and expected.
- **Not diversified alpha.** Profit is concentrated: the top handful of coins account for essentially all net PnL in the test window. Missing the best trades (or skipping signals) breaks the strategy.
- **Not scalable.** The edge lives in small, newly-listed coins and decays quickly with size; it is suitable for small capital only.
- **Not a smooth-equity product.** Two months (Sep 2025, Apr 2026) produced most of the test-period return.
- **Not a guarantee.** One market cycle of evidence; live execution (fills, slippage) will differ from the model.

Results shown are based on historical and walk-forward (out-of-sample) backtesting and are provided for informational purposes only. Past performance is not indicative of future results. Figures are gross of taxes and assume modeled execution; live trading results will differ. This document is not investment advice or an offer to manage funds.
